ABSTRACT. The present paper focuses on means of creating a framework for e-learning services by integrating learning and dedicated information systems facilities within a web portal. The information system facilities are provided into the web portal by retrieving the dedicated software services from the specific systems and synchronizing databases based on various technologies (php / postgresql, asp / MS sql). The portal uses MS technology and provides, as learning services, management content and e-learning facilities for various user categories, together with the dedicated information system facilities.
